

The Energy Supplement For Cannabis

Plant growth requires energy at all stages of development, and carbohydrates play a critical role in bigger, healthier plants. At the growing stage, plants are able to store carbohydrates for later use.

But while big plants are great, it's big buds that generate income, and at the very time the plant is going through the high stress of reproduction (flowering, budding) in hydroponics, it needs to draw on those carb reserves because it can no longer produce them, and there are no soil sources

***Carbs** gives your plants the extra energy when it's needed most for bigger, higher value buds.*

Promotes Enhanced Flowering & Buds

When the plant is undergoing its most demanding stage of growth – producing flowers and buds – it needs the extra boost of carbohydrate energy to maximize its genetic potential. **Carbs** provides that energy, leading to increased reproductive activity, which means more and larger buds in your crop.

Maximizes Plant Health

Carbohydrates support plant health and energy in much the same way they do for humans. In photosynthesis, carbohydrates are part of plant nitrogen metabolism to create the proteins for growth. Including **Carbs** in your fertilizer program supports the plant's needs for better health.

Superior Nutrition Will Yield Maximum Results

Providing energy support when your plants need it most

During early and mid-growth stages of development, cannabis plants – like many others – store carbons and carbohydrates in vacuoles for later use. This is part of the complex and natural process by which plants are able to maintain growth and defend against stresses.

Even the best cared-for plants can not maintain carbohydrate processing during the increased stress of reproduction., especially in hydroponics.

Carbs answers this need with more than simple sugars, but rather with a special blend of sucrose and amino acids that not only support sustained reproductive growth, but also feeding the microbial activity that enhances nutrient availability.

The development of **Carbs** incorporates Food Grade Standards, ensuring an approach to plant nutrition and a final product that is free of manufactured toxins. With natural ingredients, along with high efficiency nutrients, you are assured of effective and sustainable cannabis plant nutrition.

An experienced staff of Agronomists, chemists and soil scientists make our team unique, with years of real world experience in plant and soil science. Our expertise provides you with a competitive edge to succeed in the complex and challenging cannabis marketplace.
