Quality Yields **Start** With Healthy Soil

Professional agricultural growers have known for years that for any crop to reach its potential, proper soil conditions are essential for establishment and early plant growth.

Microbial activity –frequently highly dormant in typical potting soils, and nonexistent in a “soiless” medium – has to be enhanced to release nutrients for plant uptake. Young plants do not yet have the root system to excrete the chemicals to develop microbial activity, which is why early stage soil treatments are so important.

***Start** is the ultimate solution for putting your cannabis plants on the path toward strong, productive growth, with optimum yield volume and quality.*

Feed the soil that feeds your plants

Seaweed extract in **Start** stimulates beneficial microbial populations in the soil, an important aspect of starting any cannabis seed or transplant. Microbes play a vital role in plant establishment by colonizing the root zone of the plant to assimilate nutrients and help make soil nutrients available in the early stages of growth.

Enhance establishment and early growth

Yucca extract not only helps increase microbial activity, but also aids in retaining moisture in the root zone, mitigating the very real risks of dehydration. With Fulvic and Humic acids, amino acids, and a micro nutrient package, **Start** provides for the growing environment that increases establishment and gives young plants the best start toward fulfilling their genetic potential.

Superior Nutrition Will Yield Maximum Results

An experienced staff of Agronomists, chemists and soil scientists make our team unique, with years of real world experience in plant and soil science. Our expertise provides you with a competitive edge to succeed in the complex and challenging cannabis marketplace.

The Best **START** For Your Plants:

The unique ingredients in **Start** include natural non-plant food ingredients that are shown to promote microbial activity, boost root growth and mass, as well as enhance plants' natural defenses against stress:

CHITINS:

Provide a natural defense against harmful bio organisms, creating a more beneficial growing environment.

CYTOKININS:

Hormones found in seaweed that enhance the speed of cellular division and stimulate photosynthesis.

AUXINS:

Hormones from seaweed that allow cell walls to stretch, increasing cell elongation, and minimize cell deterioration that results in rotting.

YUCCA:

A natural wetting agent that reduces soil surface tension and enhances moisture retention in the root zone.

These ingredients, along with the NPK and micronutrient blend, are part of a complete program of soil replenishment – in a single package to give your cannabis its best start!

A complete program for Cannabis:

Start

Prepare your soil to give the plant its best environment to reach its genetic potential. **Start** boosts microbial activity in the soil, enhancing plant establishment and assists in nutrient uptake at this critical stage of growth.

Grow

Provides the balanced nutrition (NPK) for satisfying requirements for the first vegetative life stage of cannabis. **Grow** provides high Nitrogen (N), medium Phosphorous (P) and high Potassium (K) along with Amino Acids, Carbon Humic and Fulvic acids to supply the plant with the nutrients needed during this high energy growth cycle.

Bloom

NPK, along with sugars and essential micro-nutrients support plant strength during the reproductive phase. **Bloom** enhances bud quality and quantity with nutrients proven to support plant strength through this energy-intensive growth stage.
